Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being prinand is derived by analysis of the total score distribution.

New self-excising polynucleotides, useful for producing transgenic

Claim

5

food

```
The invention describes an isolated excisable polynucleotide, which comprises a desired trait polynucleotide are recombinase polynucleotide operably linked to a promoter, all flanked by a pair of directly oriented self-excising polynucleotide is useful for producing transgenic plants, encode a gene product from the transgenic nucleic acid sequences that original genetic configuration of the genome. The polynucleotide is also is seful in methods for eliminating unwanted nucleic acids in agricultural food products and for preventing the escape of certain transgenic traits phic31intINT, created for use in the self-excising polynucleotide is phic31intINT, created for use in the self-excising polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                plants, removing transgenes fi

                                                                                                                                                                                                                         The invention describes an isolated excisable polynucleotide, which comprises a desired trait polynucleotide and a recombinase polynucleotid operably linked to a promoter, all flanked by a pair of directly oriented recombination sites where the recombinase activity is regulatable. The self-excising polynucleotide is useful for producing transgenic plants, particularly for removing all transgenic nucleic acid sequences that encode a gene product from the transgenic plant, thus restoring the original genetic configuration of the genome. The polynucleotide is also useful in methods for eliminating unwanted nucleic acids in agricultural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New self-excising polynucleotides, useful for producing transplants, removing transgenes from these plants or crops (e.g. commodities), and restricting the distribution of transgenes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO200216609-A2.

The self-excising polynucleotide is useful for producing transgenic plants, particularly for removing all transgenic nucleic acid sequences that encode a gene product from the transgenic plant, thus restoring the original genetic configuration of the genome. The polynucleotide is also useful in methods for eliminating unwanted nucleic acids in agricultural food products and for preventing the escape of certain transgenic traits into the environment. This sequence encodes the novel phic31 integrase phic31int*INT, created for use in the self-excising polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (BADI )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New self-excising polynucleotides, useful for producing transgenic plants, removing transgenes from these plants or crops (e.g. food commondities), and restricting the distribution of transgenes within
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            environment

```
New gene trapping construct capable of causing conditional mutations in genes, comprises functional DNA segment inserted in sense or antisense direction relative to gene to be trapped
```

WPI; 2001-308486/32.

Example 78pp; English

standard DNA segment. One of the DNA segment (disruption cassette) is inserted in antisense orientation relative to the transcriptional orientation of the gene to be trapped. The other DNA segment (selection cassette) is inserted in sense direction relative to the transcriptional orientation of the gene to be trapped. The cell comprising the gene trapping construct is useful for the identification and/or isolation of genes. The transgenic organism comprising the gene trapping construct is useful for the identification and/or isolation of useful to study gene function at various developmental stages. The gene trapping construct is useful for mutationally inactivating all cellular genes. The present sequence is an expression vector pRK65. The pRK65 is used for the expression of phic31 integrase to detect C31-Int (a phic31 phage derived integrase) mediated inversion. two recombinase recognition sequences (RRSs) specific to site specific recombinase which is capable of unidirectional inversion of double standard DNA segment. One of the DNA segment (disruption cassette) is The present invention relates to a conditional gene trapping construct capable of causing conditional mutations in genes. The gene trapping construct comprises two functional DNA segments, each being flanked by lanked by specific

Sequence 5711 BP; 1329 A; 1512 C; 1616 G; 1254 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
             CC recombinases. The method comprises transforming cells with a first CC plasmid comprising two recombination sites and a coding sequence of conterest, and a second plasmid encoding an altered recombinase; allowing recombination of the two recombination sites using the altered recombination of the two recombination sites using the altered comprising the comprising the composition of the sequence of interest; and identifying the altered recombinase. The altered recombinase is useful for site-specifically contegrating a polynucleotide sequence of interest in a genome of a cell. Contegrating a polynucleotide sequence of interest in a genome of a cell. Contegrating a polynucleotide sequence of interest in a genome of a cell. Contegrating a polynucleotide sequence of interest in a genome of a cell. Contegrating a polynucleotide sequence of interest in a genome of a cell. Contegrating a polynucleotide sequence of interest in a genome of a cell. Contegration of transgenic cells, tissues, plants and animals. Contegration of transgenic cells, tissues, plants animals. Contegration of transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cystic fibrosis; familial-hypercholesterolaemia; haemophilia; chronic granulomatous disease; Duchenne's muscular dystrophy; Fanconi's disease; anemia; sickle-cell anemia; Gaucher's diseauthunter's syndrome; X-linked severe combined immunodeficiency; infectious disease; acquired disorder; tumour; cancer; integra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                 The specification describes a method for identifying altered recombinases. The method comprises transforming cells with a first plasmid comprising two recombination sites and a coding sequence of interest, and a second plasmid encoding an altered recombinase; allowing recombination of the two recombination sites using the altered recombinase; screening and isolating transformed cells comprising the product of the sequence of interest; and identifying the altered recombinase. The altered recombinase is useful for site-specifically integrating a polymucleotide sequence of interest in a genome of a cell. It is also useful in genetic engineering of chromosomes of higher cells, and for the generation of transgenic cells, tissues, plants and animals.
The altered recombinase is useful for treating monogenic disorders, e.g. ADA deficiency, cystic fibrosis, familial-hypercholesterolaemia, anemia, chronic granulomatous disease, Duchenne's muscular dystrophy, haemophilia, Fanconi's disease, sickle-cell anemia
                                                                                                                                                                                                                                                                                                      Identifying altered recombinase, involves hybridizing recombination sites in cells having specific coding sequence, transformed with altered recombinase gene, and isolating cells having product of the

```
The specification describes a method for identifying altered recombinases. The method comprises transforming cells with a first plasmid comprising two recombination sites and a coding sequence of interest, and a second plasmid encoding an altered recombinase; allowing recombination of the two recombination sites using the altered recombinates; screening and isolating transformed cells comprising the product of the sequence of interest; and identifying the altered recombinase. The altered recombinase is useful for site-specifically integrating a polynucleotide sequence of interest in a genome of a cell. It is also useful in genetic engineering of chromosomes of higher cells, and for the generation of transgenic cells, tissues, plants and animals. The altered recombinase is useful for treating monogenic disorders, e.g. And deficiency, cystic fibrosis, familial-hypercholesterolaemia, anemia, chronic granulomatous disease, Duchenne's muscular dystrophy,
haemophilia, Fanconi's disease, sickle-cell anemia, Gaucher's disease, Hunter's syndrome and X-linked severe combined immunodeficiency (SCID) infectious diseases including viral anotherial infections, acquired disorders including solid tumours and haematopoietic cancers such as leukaemias and lymphomas, and other cancers. The present sequence encodes an altered recombinase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinase; genetic engineering; monogenic disorder; ADA deficiency; cystic fibrosis; familial-hypercholesterolaemia; haemophilia; chronic granulomatous disease; Duchenne's muscular dystrophy; Fanconi's disease; anemia; sickle-cell anemia; Gaucher's disease; Hunter's syndrome; X-linked severe combined immunodeficiency; SCID; infectious disease; acquired disorder; tumour; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The specification describes a method for identifying altered CC recombinases. The method comprises transforming cells with a first CC plasmid comprising two recombination sites and a coding sequence of CC interest, and a second plasmid encoding an altered recombinase; allowing CC recombination of the two recombination sites using the altered CC recombinates screening and isolating transformed cells comprising the CC product of the sequence of interest; and identifying the altered CC recombinase. The altered recombinase is useful for site-specifically CC integrating a polynucleotide sequence of interest in a genome of a cell. It is also useful in genetic engineering of chromosomes of higher cells, CC and for the generation of transgenic cells, tissues, plants and animals. CC and for the generation of transgenic cells, tissues, plants and animals. CC anemia, chronic granulomatous disease, buchenne's muscular dystrophy, CC haemophilia, Fanconi's disease, sickle-cell anemia, Gaucher's disease, CC uniter's syndrome and x-linked severe combined immunodeficiency (SCID), CC infectious diseases including viral and bacterial infections, acquired CC disorders including solid tumours and haematopoletic cancers such as CC leukaemias and lymphomas, and other cancers. The present sequence CC encodes an altered recombinase of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
The invention relates to Cestrum yellow leaf curling virus (CmYLCV) novel DNA sequences which functions as transcription promoters of an associated polynucleotide sequence. These CmYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which

These CmYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which are used for creating transgenic plants expressing DNA of interest at all times and in most tissues and organs. The present DNA sequence is a promoter reporter cassette which contains CmYLCV CmpC promoter fragment, green fluorescent protein-1 synGFP1 reporter gene and the Agrobacterium tumefaciens nopaline synthase (NOS) terminator. Promoter-reporter cassette is used to construct plant transformation vector.

The present DNA sequence is a promoter-reporter cassette which contains CMYLCV Caps promoter fragment, green fluorescent protein-1 synGFP1 reporter gene and the Agrobacterium tumefaciens nopaline synthase (NOS) terminator. Promoter-reporter cassette is used to construct plant transformation vector.

The pressing DNA of interest at all Ubq3(At)-synGFP1-NOS terminator expression cassette which comprises Arabidopsis thallana ubiquitin 3 promoter, Ubq3(At) operatively linked with green fluorescent protein-1, synGFP1 reporter gene and Agrobacterium tumefaciens nopaline synthase (NOS) terminator. This expression cassette is used for the construction of plant transformation vectors.

                                                                                                                                                                                                                                                                                             2011
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to Cestrum yellow leaf curling virus (CmYLCV) novel DNA sequences which functions as transcription promoters of an associated polynucleotide sequence. These CmYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 2943 BP;
